EP-IR-EXTENDER

The Epic IR Extender extends infrared capability by converting IR signals to digital data, which can then be read from any PC or RS232 serial port. The EP-IRE is designed for use with various IR input devices to capture IR commands that can be recorded, played back, and used to initiate actions across a network. For the first time, an IR device, such as a remote control, can be used as an input device for equipment control throughout the home. For instance, by pressing a button on your bedroom remote you can adjust lighting, set your home's temperature, and lower shades. The EP-IRE is the first IR extender able to support the full IR frequency spectrum from 30KHz to 500KHz.
